ABSTRACT

A new combination, *Tournefortia kirkii*, is published, recognizing *Tournefortia puberula* var. *kirkii* as a distinct species. An increase in available collections demonstrates that this taxon is more widespread than originally supposed and that it occurs sympatrically with *T. puberula* while maintaining its distinct morphology, thus meriting recognition as a distinct species.

KEY WORDS

Tournefortia,
Boraginaceae,
Madagascar.

RÉSUMÉ

Tournefortia kirkii (I.M. Johnston) J.S. Mill. (Boraginaceae): Une nouvelle combinaison pour une espèce de Madagascar.

Une nouvelle combinaison, *Tournefortia kirkii*, est établie à la suite de la reconnaissance de *Tournefortia puberula* var. *kirkii* en tant qu'espèce distincte. L'accroissement du nombre de récoltes démontre que ce taxon est plus répandu qu'on ne le pensait et qu'il se trouve en sympatrie avec *T. puberula* tout en conservant sa propre morphologie, méritant ainsi d'être reconnu comme une espèce distincte.

MOTS CLÉS

Tournefortia,
Boraginaceae,
Madagascar.

The genus *Tournefortia* L. (Boraginaceae, subfamily Heliotropioideae) consists of approximately 150 species (MILLER 1988) and is represented in most warm areas of the world, but the majority of the species occur in the New World tropics. Three sections have been recognized in the genus and some recent authors (e.g. MARTINS 1990; VERDCOURT 1991) have chosen to separate some species into *Argusia*

Amman, but NOWICKE & SKVARLA (1974) have shown that variation in pollen morphology does not support this distinction. Given that the vast majority of morphological complexity in *Tournefortia* occurs among the New World species, and perhaps even its distinction from *Heliotropium* L. is artificial, I have adopted a conservative generic concept, preferring to wait for further molecular evidence before

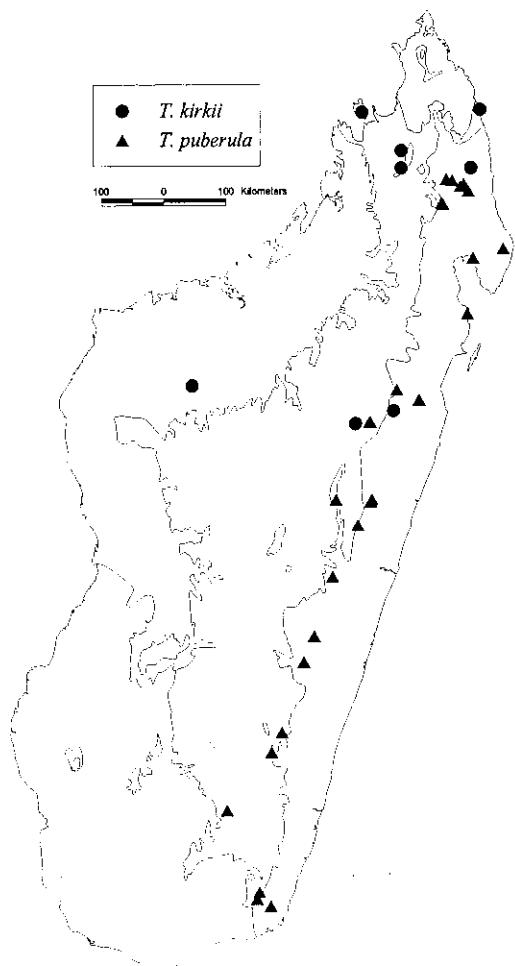

Fig. 1. — Distributions of *Tournefortia kirkii* and *T. puberula* in Madagascar.

attempting redefinition of the genera of the Heliotropioideae.

The Old World species of *Tournefortia* were treated by JOHNSTON (1935), who recognized 12 species in sect. *Tournefortia*. Four of these, *T. acuminata* DC., *T. arborescens* Lam., *T. bojeri* A. DC., and *T. puberula* Baker were from islands of the western Indian Ocean, the later being the only species of the section known from Madagascar. In his treatment, JOHNSTON (1935) also described *T. puberula* var. *kirkii* I.M. Johnston, a variety known from a small number of collections from islands off of northeastern Madagascar and the adjacent Comores. JOHNSTON distin-

guished it from typical *Tournefortia puberula* in occurring in more arid regions and having a stiff white strigose indument on the stems, petioles, and inflorescence branches, that is sometimes found on the lower leaf surface as well. The typical *T. puberula* was characterized by having minute brown puberulent stems, petioles, and inflorescence branches and occurred in moist to wet forests of central-eastern Madagascar.

These two taxa are currently known from much greater numbers of collections than were available to JOHNSTON. From recent study of these collections during preparation of an account of Boraginaceae for the Flore de Madagascar et des Comores, it is apparent that the distributions of the two taxa overlap significantly (Fig. 1) and that the morphological differences seem to be maintained even when the two grow sympatrically, such as around Ambatondrazaka and in the Zahamena National Park. Because of this, I have chosen to elevate *Tournefortia puberula* var. *kirkii* and recognize it as a distinct species necessitating the following new combination and emended descriptions.

Tournefortia kirkii (I.M. Johnston) J.S. Mill., comb. nov.

Tournefortia puberula var. *kirkii* I.M. Johnston, J. Arnold Arbor. 16: 158 (1935). — Type: Kirk s.n., "Tournefortia 3", Comores, Mohilla Island, fl., Apr. 1861 (holo-, K!).

Woody vine or scrambling shrub, the twigs strigillose to hispidulous, the hairs silaceous, white. Leaves alternate, persistent; blades ovate to elliptic or narrowly elliptic, the widest point below or rarely at or slightly above the middle, 6–11 × 2–4.5 cm, the apex acuminate to acute, the base obtuse to acute or approaching rounded, the margin entire, sometimes minutely and tightly revolute, the adaxial surface moderately to sparsely strigillose, the adaxial surface densely to sparsely puberulent or nearly glabrous, but always puberulent on the midrib; venation brochidodromous, the midrib slightly impressed on the adaxial surface, raised on the abaxial surface, the secondary veins 6–8, the tertiary venation reticu-

late; petioles 5-15 mm long, canaliculate on the adaxial surface, densely to moderately strigillose or puberulent.

Inflorescences terminal, well-branched cymes 6-15 cm broad, the peduncle 3-7 cm long, the peduncle and branches strigillose to hispidulous, the hairs silaceous. Flowers bisexual; sepals 5, lanceolate, uneven, 1-2.5 × 0.3-0.7 mm, attenuate, strigillose; corolla white, tubular, 4-9 mm long, strigillose on the upper, outer surface, with 5 spreading and apically reflexed lobes, the lobes ovate, c. 1 mm long; stamens 5, the filaments 1-2 mm long, adnate to the tube for their entire length, anthers lanceoloid 1-1.5 mm long; ovary ovoid, 0.7-1 × 0.7-1 mm, the style less than 1 mm long, the stigma capitate, slightly bilobed.

Fruits drupaceous, white at maturity, ovoid, 2.5-3 × 2.5-3 mm, the exocarp thin, the endocarp bony, separating into 2, 2-seeded carpels at maturity.

DISTRIBUTION. — *Tournefortia kirkii* is known from the Comores, Nosy Be off the northeast coast of Madagascar, and from several scattered localities in northern Madagascar north of 18°S from near sea level to 1300 m in elevation.

Tournefortia kirkii has white, mineralized, appressed hairs, which easily separate it from *T. puberula*, which is glabrous or minutely brown puberulent. In addition, the corollas of *T. kirkii* (4-9 mm) are generally longer than those of *T. puberula* (3-5 mm).

Tournefortia puberula Baker

J. Linn. Soc. London 20: 211. 1883; I.M. Johnston, J. Arnold Arbor. 16: 158 (1935). — Type: Baron 1957, Central Madagascar, Oct. 1882 (holo-, K!; iso-, B, BM, P!).

Tournefortia mocquerysii A. DC., Bull. Herb. Boissier, ser. 2, 1: 581 (1901), "mocquerysi". — Type: Mocquerys 161, Madagascar, forest at head of Antongil Bay (holo-, G-DEL).

Climbing or scrambling vine or shrub or small tree to 8 m tall, the twigs glabrous to minutely brown puberulent, the hairs not mineralized and not white. Leaves alternate, persistent; blades ovate to lance ovate or narrowly elliptic, the widest point below or occasionally at the middle, 5-12 × 2.3-6.5 cm long, the apex acuminate, the base rounded or slightly cordate to obtuse or rarely acute, the margin entire, but usually minutely and tightly revolute, both surfaces glabrous; the venation brochidodromous, the midrib even with the adaxial surface or slightly impressed, raised on the abaxial surface, the secondary veins 4-6, the tertiary veins reticulate; petioles 7-23 mm long, prominently canaliculate on the adaxial surface, glabrous to minutely brown puberulent.

Inflorescences terminal, a well-branched cyme, 7-20 cm broad, the peduncle 15-30 mm long, peduncle and branches glabrous to minutely brown puberulent. Flowers bisexual; sepals 5, triangular, somewhat uneven, 1.5-3 × 0.5-1 mm, sharply acute to attenuate at the apex, glabrous or sparsely strigillose; corolla white, tubular with 5 spreading and apically recurved lobes, 3-5 mm

long, the lobes 5, ovate, c. 1 mm long; stamens 5, the filaments 2-3 mm long, adnate to the tube for their full length, the anthers lanceoloid, c. 1 mm long; ovary ovoid 1-1.5 × 0.7-1 mm, the style less than 1 mm, the stigma capitulate, somewhat bilobed.

Fruits drupaceous, white at maturity, broad ovoid, 3-6 × 5-7 mm, the exocarp thin, the endocarp bony, separating into 2, 2-seeded carpels at maturity.

VERNACULAR NAMES. — *laharohy*, lardy, trontaka, *vahibe*, varaina.

DISTRIBUTION. — *Tournefortia puberula* occurs in eastern wet forests from about 14°S, around the Marojejy massif, to the Ft. Dauphin region near 25°S from near sea level to 1700 m. It is a relatively common species along edges of forests and streams.

Acknowledgements

Fieldwork to study Malagasy Boraginaceae was generously supported by grant 4288-90 from the National Geographic Society. I thank J. ANDRIATIANA, R. KEATING, L. MILLER, P. PHILLIPSON, A. RANDRIANASOLO, and G. SCHATZ for accompanying me and assisting with fieldwork. P. LOWRY was of special help in many ways, facilitating fieldwork and help with all aspects of preparation of the manuscript. I thank the curators of K and P for loan of specimens and hospitality during herbarium visits and Prof. Ph. MORAT for the possibility to finish this in Paris. This manuscript was completed while serving as a "Chercheur associé" at the Laboratoire de Phanérogamie, Muséum National d'Histoire Naturelle. I thank J.-N. LABAT and the staff at P for their help during my visit. I also thank

S. ANDRIAMBOLONERA, J. RAHARIMAMPIONONA, and K. SIKES for help compiling specimen data. Adam BRADLEY provided bibliographic assistance and T. CONSIGLIO prepared the distribution map. Fieldwork essential to this study was conducted under a collaborative agreement between the Missouri Botanical Garden and the Parc Botanique et Zoologique de Tsimbazaza, Antananarivo, Madagascar. I gratefully acknowledge courtesies extended by the Government of Madagascar (Direction Générale de la Gestion des Ressources Forestières).
